OUTLINE

The R5220x Series are CMOS-based PWM step-down DC/DC Converters with synchronous rectifier, low supply current and LDO mode.

DC/DC converter of the R5220x consists of an oscillator, a PWM control circuit, a reference voltage unit, an error amplifier, a soft-start circuit, protection circuits, a protection against miss operation under low voltage (UVLO), PWM-DC to DC converter / LDO alternative circuit, a chip enable circuit, and a driver transistor. A high efficiency step-down DC/DC converter can be easily composed of this IC with only a few kinds of external components, or an inductor and capacitors.

LDO of the R5220x consists of a vortage reference unit, an error amplifier, resistors for voltage setting, output current limit circuit, a driver transistor, and so on. The output voltage is fixed internally in the R5220x. The output voltage of the DC/DC converter and the LDO can be set independently.

PWM step-down DC/DC converter / LDO alternative circuit is active with Mode Pin of the R5220x Series. Thus, when the load current is small, the operation can be switching into the LDO operation from PWM operation by the logic of MODE pin and the consumption current of the IC itself will be small at light load current. As protection circuits, the current limit circuit which limits peak current of Lx at each clock cycle, and the latch type protection circuit which works if the term of the over-current condition keeps on a certain time in PWM mode. Latch-type protection circuit works to latch an internal driver with keeping it disable. To release the protection, after disable this IC with a chip enable circuit, enable it again, or restart this IC with power-on or make the supply voltage at UVLO detector threshold level or lower than UVLO.

FEATURES

- Supply Current .................................................................Typ. 350µA (DC/DC), Typ. 5µA (VR)
- Standby Current ..............................................................Typ. 0.1µA
- Built-in Driver ON Resistance ......................................P-channel 0.5Ω, N-channel 0.5Ω (at VIN=3.6V)
- Output Current ...............................................................Min. 400mA (DC/DC), Min. 50mA (VR)
- Input Voltage .................................................................2.8V to 5.5V (Absolute Input Maximum: 6.5V)
- Output Voltage ...............................................................1.0V to 3.3V (0.1V steps)

(For other voltages, please refer to MARK INFORMATIONS.)

- Output Voltage Accuracy .............................................±2.0% (VOUT ≥ 1.5), ±30mV (VOUT <1.5V)
- Oscillator Frequency (DC/DC) .....................................Typ. 1.2MHz
- Package .................................................................SON-6, DFN(PLP)2514-6
- Built-in Soft-start Function .............................................Typ. 0.2ms
- Latch-type Protection Function (Delay Time).............Typ. 3.0ms
- Built-in fold-back protection circuit (DC/DC, VR)
- Ceramic Capacitor is recommended.

APPLICATIONS

- Power source for portable equipment such as DSC, DVC, and communication equipment.
**SELECTION GUIDE**

In the R5220x Series, the output voltage, the version and the pin polarities for the ICs can be selected at the user's request.

<table>

xx : Output Voltage (V_{OUT}) or serial number.

The output voltage can be designed in the range from 1.0V(10) to 3.3V(33) in 0.1V steps.

(If selected the custom-made product) The output voltage can be designed by Serial numbers. Please refer to the attached Mark Informations.

* : (1) Standard (DC/DC output voltage = LDO output voltage)
(2) Custom-made (DC/DC output voltage ≠ LDO output voltage)

$ : Designation of chip enable and Mode pin polarities

(A) Mode pin; "H"=DC/DC converter mode, "L"=LDO Mode
(B) Mode pin; "L"=DC/DC converter mode, "H"=LDO Mode

---

* R5220D (SON-6) is the discontinued product as of March 2019.

*) For Power Dissipation, please refer to PACKAGE INFORMATION.

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field.

The functional operation at or over these absolute maximum ratings is not assured.

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

External Components

- Set external components such as an inductor, C_IN, C_OUT as close as possible to the IC, in particular, minimize the wiring to V_IN pin and GND pin. If VDD line or GND line's impedance is high, the internal voltage level of the IC may fluctuate and the operation may be unstable. Make GND line and V_DD line sufficient. Through the V_DD line, the GND line, the inductor, Lx pin, and V_OUT line, a large current caused by switching may flow, therefore, those lines should be sufficient and avoid the cross talk with other sensitive lines. Use the individual line from the V_OUT pin of the IC for the inductor and the capacitor and load.

- Use a low ESR ceramic capacitor C_OUT/C_IN with a capacity of 10μF or more.

- Select an inductor with an inductance range from 4.7μH to 10μH. The internal phase compensation is secured with these inductance values and C_OUT value. Choose the inductor with a low DC resistance and enough permissible current and hard to reach magnetic saturation. In terms of inductance value, choose the appropriate value with considering the conditions of the input voltage range and the output voltage, and load current. If the inductance value is too small and the load current is large, the peak current of Lx may reach the Lx current limit, and the protection against over-current may work.

- The protection circuit against over-current is affected by the self-heating and the heat radiation environment. Therefore evaluate under the considerable environment of the application.

The performance of power source circuits using these ICs extremely depends upon the peripheral circuits. Pay attention in the selection of the peripheral circuits. In particular, design the peripheral circuits in a way that the values such as voltage, current, and power of each component, PCB patterns and the IC do not exceed their respected rated values.

* R5220D (SON-6) is the discontinued product as of March 2019.
**OPERATION of step-down DC/DC converter and Output Current**

The step-down DC/DC converter charges energy in the inductor when Lx transistor is ON, and discharges the energy from the inductor when Lx transistor is OFF and controls with less energy loss, so that a lower output voltage than the input voltage is obtained. The operation will be explained with reference to the following diagrams:

1. **Step 1:** P-channel Tr. turns on and current IL (=i1) flows, and energy is charged into CL. At this moment, IL increases from ILmin (=0) to reach ILmax in proportion to the on-time period (ton) of P-channel Tr.
2. **Step 2:** When P-channel Tr. turns off, Synchronous rectifier N-channel Tr. turns on in order that L maintains IL at ILmax, and current IL (=i2) flows.
3. **Step 3:** IL (=i2) decreases gradually and reaches IL=ILmin=0 after a time period of topen, and N-channel Tr. Turns off. Provided that in the continuous mode, next cycle starts before IL becomes to 0 because toff time is not enough. In this case, IL value increases from this ILmin (>0).

In the case of PWM control system, the output voltage is maintained by controlling the on-time period (ton), with the oscillator frequency (fosc) being maintained constant.

The maximum value (ILmax) and the minimum value (ILmin) of the current flowing through the inductor are the same as those when P-channel Tr. turns on and off.

The difference between ILmax and ILmin, which is represented by $\Delta I$;

$$\Delta I = ILmax - ILmin = V_{OUT} \times topen / L = (V_{IN} - V_{OUT}) \times ton / L$$ .................................................. Equation 1

wherein, \( T = 1 / fosc = ton + toff \)

\[ \text{duty (\%)} = \frac{ton}{T} \times 100 = \frac{ton \times fosc}{100} \]

\[ \text{topen} \leq toff \]

In Equation 1, \( V_{OUT} \times topen / L \) and \( (V_{IN} - V_{OUT}) \times ton / L \) respectively show the change of the current at "ON", and the change of the current at "OFF".
OUTPUT CURRENT AND SELECTION OF EXTERNAL COMPONENTS

When P-channel Tr. of Lx is ON:

(Wherein, Ripple Current P-P value is described as IRP, ON resistance of P-channel Tr. and N-channel Tr. of Lx are respectively described as RONP and RONN, and the DC resistor of the inductor is described as RL.)

\[
V_{IN} = V_{OUT} + (R_{ONP} + R_L) \times I_{OUT} + L \times \frac{IRP}{ton} \]

Equation 2

When P-channel Tr. of Lx is "OFF" (N-channel Tr. is "ON"):

\[
L \times \frac{IRP}{toff} = R_{ONN} \times I_{OUT} + V_{OUT} + R_L \times I_{OUT} \]

Equation 3

Put Equation 3 to Equation 2 and solve for ON duty of P-channel transistor, \(ton / (toff + ton) = D_{ON}\),

\[
D_{ON} = \frac{(V_{OUT} - R_{ONN} \times I_{OUT} + R_L \times I_{OUT})}{(V_{IN} + R_{ONN} \times I_{OUT} - R_{ONP} \times I_{OUT})} \]

Equation 4

Ripple Current is as follows;

\[
IRP = (V_{IN} - V_{OUT} - R_{ONP} \times I_{OUT} - R_L \times I_{OUT}) \times D_{ON} / fosc / L \]

Equation 5

wherein, peak current that flows through L, and Lx Tr. is as follows;

\[
IL_{max} = I_{OUT} + IRP / 2 \]

Equation 6

Consider ILmax, condition of input and output and select external components.

* The above explanation is directed to the calculation in an ideal case in continuous mode.
TIMING CHART

1) IC start-up

The timing chart as shown in the next describes the operation starting the IC is enabled with CE. When the CE pin voltage becomes higher than the threshold voltage, the IC’s operations starts. At first, only the voltage regulator (VR) starts. The threshold level of the CE pin is between CE “H” input voltage and CE “L” input voltage. After starting the operation, the output capacitor (C_{OUT}) is charged with the output current of the VR, and the output level becomes the set VR output voltage. At this moment, the output of Lx is “off”, (“Hi-Z”), the pin voltage, \( V_{Lx} = V_{OUT} \) through the external inductor L.

Secondly, the Mode pin voltage is higher than the threshold voltage, internal operation of DC/DC starts. The threshold level is between Mode “H” input voltage and Mode “L” input voltage. The soft-start circuit inside the DC/DC converter’s operation is as follows:

(Case 1) DC/DC output voltage < VR output voltage

After the soft-start time, while the output voltage level is down from the VR output voltage to DC/DC output voltage, the circuit is waiting for the start of DC/DC operation. When the output voltage reaches so set DC/DC output voltage level, the actual DC/DC operation starts.

(Case 2) DC/DC output voltage > VR output voltage

The soft-start circuit of DC/DC converter makes the voltage reference unit of the IC rise gradually and be constant. After the voltage reference unit reaches the constant level which the output voltage of DC/DC converter can balance becomes the output voltage of VR, the set output voltage of DC/DC converter may be realized.

Therefore, the soft-start time means the time range of starting to the time when the voltage reference unit reaches the constant level, and the soft-start time is different from turning on speed in some cases. The operation starting time depends on the ability of the power supply, the load current, the inductance value, the capacitance value, and the voltage difference between the set VR output and the set DC/DC output.

If CE and Mode are on at once, the same operation as above is happened except the VR start-up and Soft-start operation start at the same time.

If Mode signal is forced earlier than CE signal, this IC is standby until CE signal comes. Therefore when the CE signal is set, the IC operation starts as above.

- \( V_{OUT} \) voltage rising speed at start-up with power supply is affected by the next conditions:
  1. The turning on speed of \( V_{IN} \) voltage limited by the power supply to the IC and the input capacitor \( C_{IN} \).
  2. The output capacitor, \( C_{OUT} \) value and load current.

- DC/DC operation starting time

1. If the VR output \( \geq \) DC/DC output, the operation starting time of the DC/DC converter is approximately equal to the next formula.

\[
T_{DDC,ACT} = T_{SS} + \left( V_{OUT,VR} - V_{OUT,DC/DC} + 15mV \right) \times C_{OUT} / (\text{load current at mode change} + 1 \mu A)
\]

\( T_{SS} \): Soft-start time

\( V_{OUT,VR} \): VR output voltage

\( V_{OUT,DC/DC} \): DC/DC Output Voltage

*1 \mu A is the supply current of the IC itself for the output.

2. If the VR output < DC/DC output, the operation starting time is the soft-start time + starting operation time which depends on the power supply, the load current, and the external components.

---

* R5220D (SON-6) is the discontinued product as of March 2019.
If CE pin input signal is forced earlier than the supply voltage, the voltage difference between the input and the output which is according to the input voltage to $V_{IN}$, is maintained and the $V_{OUT}$ is rising up.

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.

2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.

3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.

4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh’s or any third party’s intellectual property rights or any other rights.

5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a Ricoh product in an application mentioned in 6. below, should contact a Ricoh sales representative in advance before using such a product. Ricoh cannot approve the use of its products in life support devices or systems.

6. The products described in this document are intended for use in general electronic equipment such as personal computers, office equipment, household appliances, communication devices, motor drives,  industrial measurement devices, and transportation equipment.

7. Anti-radiation design is not implemented in the products described in this document.

8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.

9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.

10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact Ricoh sales or our distributor before attempting to use AOI.

11. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment. Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.
